

Write Up

So far we have created the basic framework for our website and worked on the initial stages of our d3 visualizations. We have one main graph that you scroll through which represents the time passing and you are able to see how many people are still running. We also have graphs at the bottom which will give aggregate data of height, weight, age and gender. We will make it so that these graphs represent the aggregate data for these stats at the time point you are at in the scroll.

The most challenging part of this project so far was explaining the ideas we had in our heads to each other and making them come to life on the computer. We found it difficult to come up with a way to make it interactive with our specific data instead of just page to page of new visualizations. At first we all had different ideas in our head of what the consensus of the Project was. Other than that, we are finding it a little bit hard to all work on the project at the same time, because it's easiest to work on it on one computer instead of creating branches with github.
